Sleep Therapy - Bi-level st, ASV, AVAPS

Mitchell Home Medical's (MHM) OptumCare Sleep therapy program offers treatment guidelines to hospital staff and physicians to help appropriately target and qualify patients for Bi-level st, ASV, AVAPS. It aims to reduce the number of hospital readmissions by providing patients effective therapy and offer patient monitoring capabilities for successful follow-up.

Data Monitoring for Successful Patient Follow-up

- Remote monitoring of patients can help determine:
 - If a patient is compliant and continuously using their NIV therapy for the recommended duration.
 - Patient's respiratory rate at home, which can help physician identify and possibly prevent an acute exacerbation.
- ResMed's Airview therapy monitoring is a comprehensive solution that empowers the caregiver to help patients achieve better therapy outcomes and manage their condition post-discharge.
- Efficacy & Compliance reports make it easy to identify patients who are not following their treatment plan so MHM can proactively pinpoint and address issues. Critical respiratory parameters provide additional insight into patient therapy: • Respiratory rate • Minute ventilation • Tidal volume • I:E ratio
- Early intervention has been shown as key to achieving long term patient compliance. Mitchell Home Medical's partnership with U-Sleep enables automated outreach and supports early detection and intervention of patient compliance and efficacy issues.
